OBSERVATION:-

I used Power Query to transform the data and prepare the tables for analysis. I created calculated columns such as Category Type, Revenue per Order, and Sales Category in the Order Details table. I also created DAX measures to calculate the total order count, average profit for orders placed in Delhi, and year-to-date (YTD) sales.

I created 9 visuals to analyse sales performance, profit, quantity, targets, monthly sales trends, and geographical sales. These included a clustered column chart, donut chart, line chart, scatter chart, cards, matrix, map, tree map, and funnel chart. I also used cards to compare the total sales amount with the sales target and a matrix to compare actual sales with targets across categories and months.
